Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Post-processing: Minimum Match 0% Maximum Match 100% Listing first 45 summaries

FUNCTION: MAY FUNCTION AS PROTECTIVE CAPPING OF THE SINGLE-STRANDED TELOMERIC OVERHANG. MAY ALSO PARTICIPATE IN TELOMERE LENGTH REGULATION DURING DAN REPLICATION. BIND SPECIFICALLY TO THE LENGTH REGULATION DURING DAN REPLICATION. BIND SPECIFICALLY TO THE THAT THE TELOMERE FROM NUCLEASE DIGESTION AND CHEMICAL MODIFICATION.

FOR THE TELOMERE FROM NUCLEASE DIGESTION AND CHEMICAL MODIFICATION.

FOR THE TELOMERE FROM NUCLEASE DIGESTION AND CHEMICAL MODIFICATION.

FOR THE TELOMERE FROM NUCLEAR.

FOR ALBANIATION.

FOR THE SOURCE OF THE A (OR ALANINE) VERSION IS SHOWN. THE S (OR SERINE) VERSION DIFFERS IN ONLY TWO POSITIONS, AND THE K VERSION IN ONLY ONE. THERE MAY BE OTHER VERSIONS IN ADDITION TO THE S. A. AND K VERSIONS.

FOR THE TELOMERE S. A. AND K VERSIONS.

--- FUNCTION: INVOLVED IN RETICULOCYTE ADHESION. SPECIFICALLY BINDS TO HUMAN RETICULOCYTE CELLS.
THE COMPLETE GROOME SEQUENCE Of the gastric pathogen Helicobacter Pine complete genome sequence of the gastric pathogen Helicobacter Hature 388:530-547(1997).

1. PUNCTION: HIE BUYN-RUVB COMPLEX IN THE PRESENCE OF ATP RENATURES CRUCIFORM: HIE WAY-RUVB COMPLEX IN SUPERCOLLED DNA WITH PALLINDROMIC SEQUENCE, INDICATING THAT IT MAY PROMOTE STRAND EXCHANGE REACTIONS IN HOLLIDAY JUNCTION HIGHATION BY LOCALIZED DENATURATION AND REAMMELING (BY SIMILARIY).

1. SUBUNIT: FORMS A COMPLEX WITH RUVA (BY SIMILARITY).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Pfam: Ff00004: AAA: 1.

pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The present invention describes primer sets for synthesising 5602 compliance in the specification. Where a primer set compliance in the specification. Where a primer set compliance in the specification. Where a primer set to the complementary strand of a polynucleotide whith comprises one of the 5602 nucleotide comprises at least 15 nucleotides: or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end sequence complementary to the polynucleotide which comprises a 1'-end sequence. Where the oligonucleotide comprises at least 15 nucleotides and the combination of the 5'-end sequence/3'-end sequence is selected from those defined in the specification. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs. The primers are also useful for the full-length cDNAs. The primers allow obtaining of the full-length cDNAs is the primers allow obtaining of the full-length cDNAs. The primers allow obtaining of the full-length cDNAs represent human cDNA sequences: AAB92446 to AAB13628 and AAB95893 represent human amino acid sequences: and AAB92802 co AAB92802 represent human amino acid sequences: and AAB92802 co AAB92802 represent buman cDNA sequences: and AAB92802 co AAB92802 control of the control of sequences.
                                                                                                                                                           Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; primer: detection; diagnosis; antisense therapy; gene therapy.

                                                                                                                                                                                                                                                                                                                     The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM8642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to traat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous system diseases, such as localised neuropathies and central nervous system diseases, such as Alzheimer's Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression. Activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic assays for receptor activity, arthritis and inflammation, leukaemias and CNNS disorders.

Where a primer set comparises: (a) an oliyo-dT primer and an oligouncleotide comprises one of the 502 nucleotide sequences defined in the specification. There the oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprises a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprises a 1'-end sequence complementary to the oligonucleotide which comprises a 3'-end sequence. The complementary to the sequence and an oligonucleotide comprises a 1'-end sequence of complementary to the oligonucleotide which comprises a 1'-end sequence. The sequence of complementary to a polynucleotide which comprises a 1'-end sequence of complementary to a complementary to a complementary for the primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers are also useful for the CDNAs assily without any specialised methods. AAH13615 to AAH13628 and AAH13631 to AAH13612 to AAH13632 to AAH13632 represent human mino acid sequences; and AAH1362 to AAH13631 content to a complement to the complement of the proposition of the proposition of the proposition of the complement to the complement of the com
                                                                                                                                                                                                                                                                                                                                                         Primer sets for synthesizing polynucleotides, particularly the fagz full-length cDNAs defined in the specification, and for the determinand/or diagnosis of the abnormality of the proteins encoded b_T the

```
The present invention describes primer sets for synthesising 5602 (ull-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dT primer and an oligounclectide complementary to the complementary strand of a polynuclectide which comprises one of the 5602 nucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end sequence of an oligonucleotide which comprises a 1'-end sequence. Where the oligonucleotide which comprises at least 15 nucleotides and the combination of the specification. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the particularly full-length cDNAs. The primers are also useful for the cDNAs. The primers are also useful for the cDNAs. The primers are also useful for the cDNAs as asily without any specialised methods. This sequence is a human transmembrane protein of the invention.

All of the proteins exist in the cell membrane, so are considered to be proteins controlling the proliferation and differentiation of the cells. They may be useful as carcinostatic agents or as antigens for preparing antibodies against the proteins. The cDNAs can be used as probes for one diagnosts and gene sources for gene therapy, as well as for large scale expression of the proteins. The HPD1498 (see AAV1393) protein may be associated with signal transduction associated with protein can be used to treat diseases associated with phopshatidylethanolamine N-methyltransferase. The Proteins are phopshatidylethanolamine N-methyltransferase. The proteins are identified by the presence of a hydrophobic transmembrane region, knowledge of the protein function is not required, as in e.g. methods of expression cloning.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       35 YLSKGTDYCSVVIIVDQTRVKL--TCLLFSGNYEALPIIYK--NGDIVRFHRLKIQVYKK 91

                                                                                                                                                                                                                                                                                                                                 Composition containing nucleic acid encoding rickettsial antigen 'useful for, e.g. stimulating protective immune response in humans or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This polypeptide comprises the major antigen protein I gene (MAPI) of Cowdria ruminantium, the causative agent of heartwater in domestic ruminants. It is encoded by the MAPI gene (see AAV07176). A claimed composition comprises a nucleic acid (see AAV07176-82) encoding a polypeptide (see AAW51080-99) that elicits a protective immune response against a rickettsial pathogen. The nucleic acid is used, in human or veterinary medicine, in vaccines to protect against Rickettsia. Ehrlichia, Anaplasma and Cowdria species. The against Rickettsia. Ehrlichia, Anaplasma and Cowdria species. The nucleic acid does not replicate in the host but remains episomal and capable of expressing polypeptide for at least 19 mth.

                                                                                                                                                                                                                  acid vaccines containing quest to protect animals or humans against rickettsial diseases caused by a organisms of Rickettsia sp., Ehrlichia sp., Anaplasma sp. or Cowdia sp. The vaccine elicits an immune response protective against the rickettsial pathogen. The vaccine comprises the major antigenic protein 1 (MAPI) gene or the major antigenic protein 2 (MAVP2) gene of rickettsial pathogen. The nucleic acid vaccines can be driven by the human cytomegalovirus (HCMV) enhancer-promoter. Covedia ruminatium genes designated map 2, thworf3, 44worf1, 18hworf1 and 3dorf3 may be used in therapeutic and diagnostic applications. The polypeptides are useful for detecting antibodies associated with infection by a rickettsial pathogen whilst the polymocleotides may be used to detect the presence of rickettsial nucleic acids.
                                                                                           New polynucleotides useful as DNA vaccines for conferring immunity to rickettsial infection e.g. heartwater caused by Cowdria ruminantium. comprises major antigenic protein 1 or 2 gene of rickettsial pathogens

                                                                                                                                                                                                       The sequence represents the amino acid sequence of major antigenic protein 1 (MAPI) isolated from Cowdria ruminantium. The MAP polynuclectides and polypeptides are useful as vaccines for conferring immunity. To rickettsia infection, including Cowdria ruminantium causing heartaster. The MAP polynucleotides may be used as molecular markers in nucleic acid analysis procedures, and to produce the MAP polypeptides, which may be used to raise antibodies that are reactive with the polypeptides. The nucleic acids may further be used as probes to identify complementary sequences within other nucleic acid molecules or acnomes, where such probes can be applied to identify or distinguish infectious strains of organisms in diagnostic procedures or in rickettsial research where identification of particular organisms or strains is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        thermostable, nucleic acid elongation; sliding clamp protein: on: reverse transcription.
                 New MAP2 genes and polypeptides useful as vaccines for conferring immunity to human and animal rickettsial diseases, e.g. heartwater, or as molecular markers in nucleic acid analysis procedures
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 A thermostable \langle \cdot \rangle witho polymenase complex for template-dependent elongation of nucleic acids in amplification or reverse transcription
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   194 pyvcagigtd---lvsvinatnpklsyggklgisysinsea--sifigg---hfbrvign 245

The introstable in vitro complex is useful for template dependent elongation of NA, e.g. for amplification or reverse transcription. This is useful for sequencing to NB by the polymerase chain reaction or reverse transcription. This is useful or sequencing complex can be used to mark NA. This sequence represents the multiple acollicus AASEOSO protein which is used to illustrate the mediation the
                                                                                                                                                                                                                                                                                                       thermostable sliding clamp protein, which is connected with it thermostable sliding clamp protein, which is connected with it thermostable sliding clamp protein, which is connected with it the thermostable in vitro accessor, which is useful for template-grounder the elongation of nucleic acids, e.g. for amplification or reverse transcription. This is useful for sequencing nucleic acids by the polymerase chain reaction or reverse transcription (RT-PCP). The complex can be used to mark nucleic acids. AAM$2000-T22084 and AM$90799 represent proteins and protein fragments used to illustrate the method of the invention.
 template-dependent elongation of nucleic acids which corrries a

It facilitates screening of e.g. pigs and elimination of infected and carrier pigs can then be examined out. The new diagnostic tests can distinguish between entirely out in the strains. It may be used in the prodn. of a varcine. See also AAR27744 and AAR27745.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This sequence represents a Helicobacter pylori GHPO protein of the invention. The polypeptides can be used for preventing or trapting Helicobacter infections, and gastroduodenal diseases associated with these infections, including acute, chronic, and atrophic gastritis, and peptic ulcer diseases, e.g. gastric and duodenal ulcers. They can also be used for the production of antibodies. The products can also be used for detection and diagnosis.

DB 19: Length 336;

The present invention describes primer sets for synthesising 5602

(iul.-length cDNAs defined in the specification. Where a primer set

(iul.-length cDNAs defined in the specification. Where a primer set

(iv. the complementary strand of a polynucleotide which comprises one of

(iv. the complementary strand of a polynucleotide which comprises one of

(iv. the 5602 nucleotide comprises at least 15 nucleotides; or (b) a combination

(iv. the 5602 nucleotide comprising a sequence complementary to the

(iv. the 5002 nucleotide comprising a sequence complementary to the

(iv. the 5002 nucleotide comprises a 1-end sequence, where the

(iv. the 5002 nucleotide comprises a 1-end sequence, where the

(iv. the 5002 nucleotide comprises a 1-end sequence, where the

(iv. the 5002 nucleotide comprises a 1-end sequence, where the

(iv. the 5003 nucleotide comprises a 1-end sequence, where the

(iv. the 5003 nucleotide comprises a 1-end sequence, where the

(iv. the 5003 nucleotide comprises a 1-end sequence, where the

(iv. the 5003 nucleotide comprises a 1-end sequence)

(iv. the 5003 nucleotide comprises a 1-end sequence)

(iv. the 5003 nucleotide comprises a 1-end sequence)

(iv. the full-length comprises a 1-end sequence)

(iv. the full-length compresent thuman companion of the full-length

(iv. the full-length compresent human companion of the full-length

(iv. the full-length companion and no acid sequences; and AMH3632 to AMH3632

(iv. the present luman amino acid sequences; and AMH3632 to AMH3632 and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs . Claim 8; SEQ ID 11188; 2537pp + CD ROM; English. of the present invention.

specification.

```
The invention relates to human nucleic acids (AAL57798-AAL61369) and the encoded polypeptides (AAM42213) with nootropic, the encoded polypeptides (AAM48642-AAM42213) with nootropic, the munosuppressant and cytostatic activity. The polymeclectides are useful immunosuppressant and cytostatic activity. The polymeclectides are useful for gene therapy. A composition containing a polypeptide or polynucleotide or polymecleotide or localised neuropathies and central nervous system diseases, such as continities and six-brane system suppression.

Calcinitation of the activity, chemotactic/chemokinetic activity, haemostatic or continity in the polymecleotide or assays for receptor activity, arthritis and inflammation, leukacmias and assays for receptor activity, arthritis and inflammation, leukacmias and continity of the order of the continity of the continit
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The sequence data for this patent did not form part of the printed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Wang D;
                                                                                                                                                                                                                                                                                                                                                                                              Human: nootropic; immunosuppressant; cytostatic; gene therapy; cancer; peripheral nervous system; neuropathy; central nervous system; CNS; Alzheimer's; Parkinson's disease; Huntington's disease; heemostatic; amyotrophic lateral scleroslis; SNy-Drager Syndrome; chemotactic; chemokinetic; thrombolytic; drug screening; arthritis; inflammation;
Novel nucleic acids and polypeptides, useful for treating disorders such as central nervous system injuries
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Ren F, W

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
